FARXIGA is a prescription medicine used along with diet and exercise to lower blood sugar in adults with type 2 diabetes. FARXIGA should not be used to treat people with type 1 diabetes or diabetic ketoacidosis (increased ketones in your blood or urine).

Not at A1C Goal?
It’s Time to Stop Waiting and Start Talking!

When you talk to your doctor, it’s important to speak up about all aspects of your type 2 diabetes management plan—especially about not being able to get to the A1C goal he or she has set for you.

To make sure you get the most out of your next doctor visit, fill out this Stop Waiting, Start Talking Discussion Guide. By answering a few important questions, you’ll have a useful tool to help you have a serious talk with your doctor about getting to your A1C goal.

Simply answer these questions and use your answers to guide your next conversation with your doctor.

How long have you been trying to reach your A1C goal?
- 6 months
- 1 year
- 18 months
- 2 years or longer

For your doctor:
Should I have seen a bigger change in my A1C by now?

What medication(s) are you taking for type 2 diabetes?
- Metformin alone
- Metformin + another medication
- Not sure

For your doctor:
Should I be considering additional medication(s)?

Is your current medication(s) making a difference?
- Yes, definitely
- Maybe/probably
- No, it doesn’t seem like it

For your doctor:
Are there other options that we should be considering?

How important is it to you to meet your A1C goal?
- Very important
- Important
- Reaching my goal would be nice

For your doctor:
What would the benefits be if I reached my A1C goal?

Has your doctor ever talked about adding FARXIGA?
- Yes, we have discussed it
- Yes, it was mentioned at one point
- No, not that I remember

For your doctor:
What can you tell me about FARXIGA?

FARXIGA may help you lower your blood sugar more than your current medication(s) alone.
- Tell me more
- I’m not interested

For your doctor:
Is adding FARXIGA an option?

FARXIGA may offer benefits beyond lowering your blood sugar.
- Tell me more
- I’m not interested

For your doctor:
What are the possible benefits of adding FARXIGA?

FARXIGA can cause serious side effects.

For your doctor:
What are the serious side effects associated with FARXIGA?

Ask your doctor about any or all of this important information about FARXIGA.

Check as many questions below as you wish.
- How does FARXIGA work?
- What are the possible side effects of FARXIGA?
- How often would I have to take FARXIGA?
- How long would it be until I saw results with FARXIGA?
- Are there ways to save money on FARXIGA?

Important Safety Information

Who should not take FARXIGA?

Do not take FARXIGA if you:
- are allergic to dapagliflozin or any of the ingredients in FARXIGA. Symptoms of a serious allergic reaction may include skin rash, raised red patches on your skin (hives), swelling of the face, lips, tongue, and throat that may cause difficulty in breathing or swallowing. If you have any of these symptoms, stop taking FARXIGA and contact your healthcare provider or go to the nearest hospital emergency room right away.

Please see additional Important Safety Information on next page. Please visit www.FARXIGAMedGuide.com for Medication Guide, and www.FARXIGAPI.com for US Full Prescribing Information for FARXIGA.
Important Safety Information (continued)

Do not take FARXIGA if you:

- have severe kidney problems or are on dialysis. Your healthcare provider should do blood tests to check how well your kidneys are working before and during your treatment with FARXIGA.

What are the possible side effects of FARXIGA?

FARXIGA may cause serious side effects including:

- **Dehydration** (the loss of body water and salt), which may cause you to feel dizzy, faint, lightheaded, or weak, especially when you stand up (orthostatic hypotension). You may be at a higher risk of dehydration if you have low blood pressure; take medicines to lower your blood pressure, including water pills (diuretics); are 65 years of age or older; are on a low salt diet, or have kidney problems.

- **Ketoacidosis** occurred in people with type 1 and type 2 diabetes during treatment with FARXIGA. Ketoacidosis is a serious condition which may require hospitalization and may lead to death. Symptoms may include nausea, tiredness, vomiting, trouble breathing, and abdominal pain. If you get any of these symptoms, stop taking FARXIGA and call your healthcare provider right away. If possible, check for ketones in your urine or blood, even if your blood sugar is less than 250 mg/dL.

- **Kidney problems.** Sudden kidney injury occurred in people taking FARXIGA. Talk to your doctor right away if you reduce the amount you eat or drink, or if you lose liquids; for example, from vomiting, diarrhea, or excessive heat exposure.

- **Serious urinary tract infections (UTI),** some that lead to hospitalization, occurred in people taking FARXIGA. Tell your doctor if you have any signs or symptoms of UTI including a burning feeling when passing urine, a need to urinate often, the need to urinate right away, pain in the lower part of your stomach (pelvis), or blood in the urine with or without fever, back pain, nausea, or vomiting.

- **Low blood sugar (hypoglycemia) can occur if you take FARXIGA with another medicine that can cause low blood sugar, such as sulfonylureas or insulin. Symptoms of low blood sugar include shaking, sweating, fast heartbeat, dizziness, hunger, headache, and irritability. Follow your healthcare provider’s instructions for treating low blood sugar.

- **Bacterial infections under the skin of the genitals and areas around them.** Rare but serious infections that cause severe tissue damage under the skin of the genitals and areas around them have happened with FARXIGA. This infection has happened in women and men and may lead to hospitalization, surgeries and death. Seek medical attention immediately if you have fever or you are feeling very weak, tired or uncomfortable and you also develop any pain or tenderness, swelling, or redness of the skin in the genitals and areas around them.

- **Vaginal yeast infections** in women who take FARXIGA. Talk to your healthcare provider if you experience vaginal odor, white or yellowish vaginal discharge (discharge may be lumpy or look like cottage cheese), or vaginal itching.

- **Yeast infection of skin around the penis (balanitis)** in men who take FARXIGA. Talk to your healthcare provider if you experience redness, itching, or swelling of the penis; rash of the penis; foul smelling discharge from the penis; or pain in the skin around penis. Certain uncircumcised men may have swelling of the penis that makes it difficult to pull back the skin around the tip of the penis.

- **Increase in bad cholesterol (LDL-C).** Your healthcare provider should check your LDL-C during treatment with FARXIGA.

- **Bladder cancer.** In studies of FARXIGA in people with diabetes, bladder cancer occurred in a few more people who were taking FARXIGA than in people who were taking other diabetes medications. There were too few cases of bladder cancer to know if bladder cancer was related to FARXIGA. Tell your healthcare provider right away if you have blood or a red color in your urine or pain while you urinate.

The most common side effects of FARXIGA include yeast infections of the vagina or penis, and changes in urination, including urgent need to urinate more often, in larger amounts, or at night.

What should I tell my healthcare provider before taking FARXIGA?

Before you take FARXIGA, tell your healthcare provider:

- all of your medical conditions, including problems with your kidneys, liver, bladder, or pancreas.

- if you have had, or have risk factors for, ketoacidosis (including type 1 diabetes, are eating less due to illness, surgery, or a change in your diet, are going to have surgery, or binge drink).

- if you are pregnant, or plan to become pregnant. FARXIGA may harm your unborn baby.

- if you are breastfeeding, or plan to breastfeed. It is unknown if FARXIGA passes into your breast milk.

- about all of the medicines you take, including prescription and nonprescription medicines, vitamins, and herbal supplements.

You are encouraged to report negative side effects of AstraZeneca prescription drugs by calling 1-800-236-9933. If you prefer to report these to the FDA, either visit www.FDA.gov/medwatch or call 1-800-FDA-1088.

If you can’t afford your medication, AstraZeneca may be able to help. For more information, please visit www.AstraZeneca-us.com.
